

# *Creating an Internet of Things Ecosystem for Transport*

*Dr Alistair Duke, BT Research and Innovation*

**Smart Systems Summit 2014 London at the IoD**  
**1-2 October 2014, London, UK**  
[www.hvm-uk.com](http://www.hvm-uk.com)

# Stride project

- To build a critical mass of easily accessible transport data
- To create a community of app developers creating innovative transport applications
  - Lowering barrier to participation
- To explore new business models & opportunities & consider technical, legal & commercial issues

# IoT ecosystem

# Portal Login Page – Developer and Provider *portal.stride-project.com*

# Data Representation

- EEML and CAP are the XML-based data representation in the hub
- Location, time, data
  - ‘data’ can be anything
- Moving to a richer semantic approach to data modelling

# Apps demonstrating value

- Driver Assist
  - Better fuel efficiency
- Journey Time Prediction
  - Predictive model + real-time information
- Travel dashboard
  - Multimodal planning
- Incident Alerting
  - Detect anomalies & mine social media
- Driver Behaviour & Driver Assist
  - BYOS (smartphone)
  
- Plus *external developers*
  - Cambridge University Transport Hackathon
  - Hackathon & Smart Cities event (Leeds)
  - Developer contest

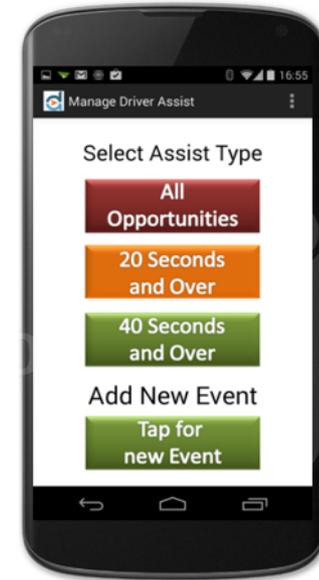

# Driver Assist Application

# Driver Assist

- Advises HGV drivers on optimum driving technique for fuel efficiency and CO2 reduction.
- Uses terrain data, road layout information, vehicle speed and other sensor data to determine the most appropriate location to start “Good Coasting” ( in gear, no throttle and no cruise control ) and maneuvering points such as junctions and slip roads

## Exploitation:

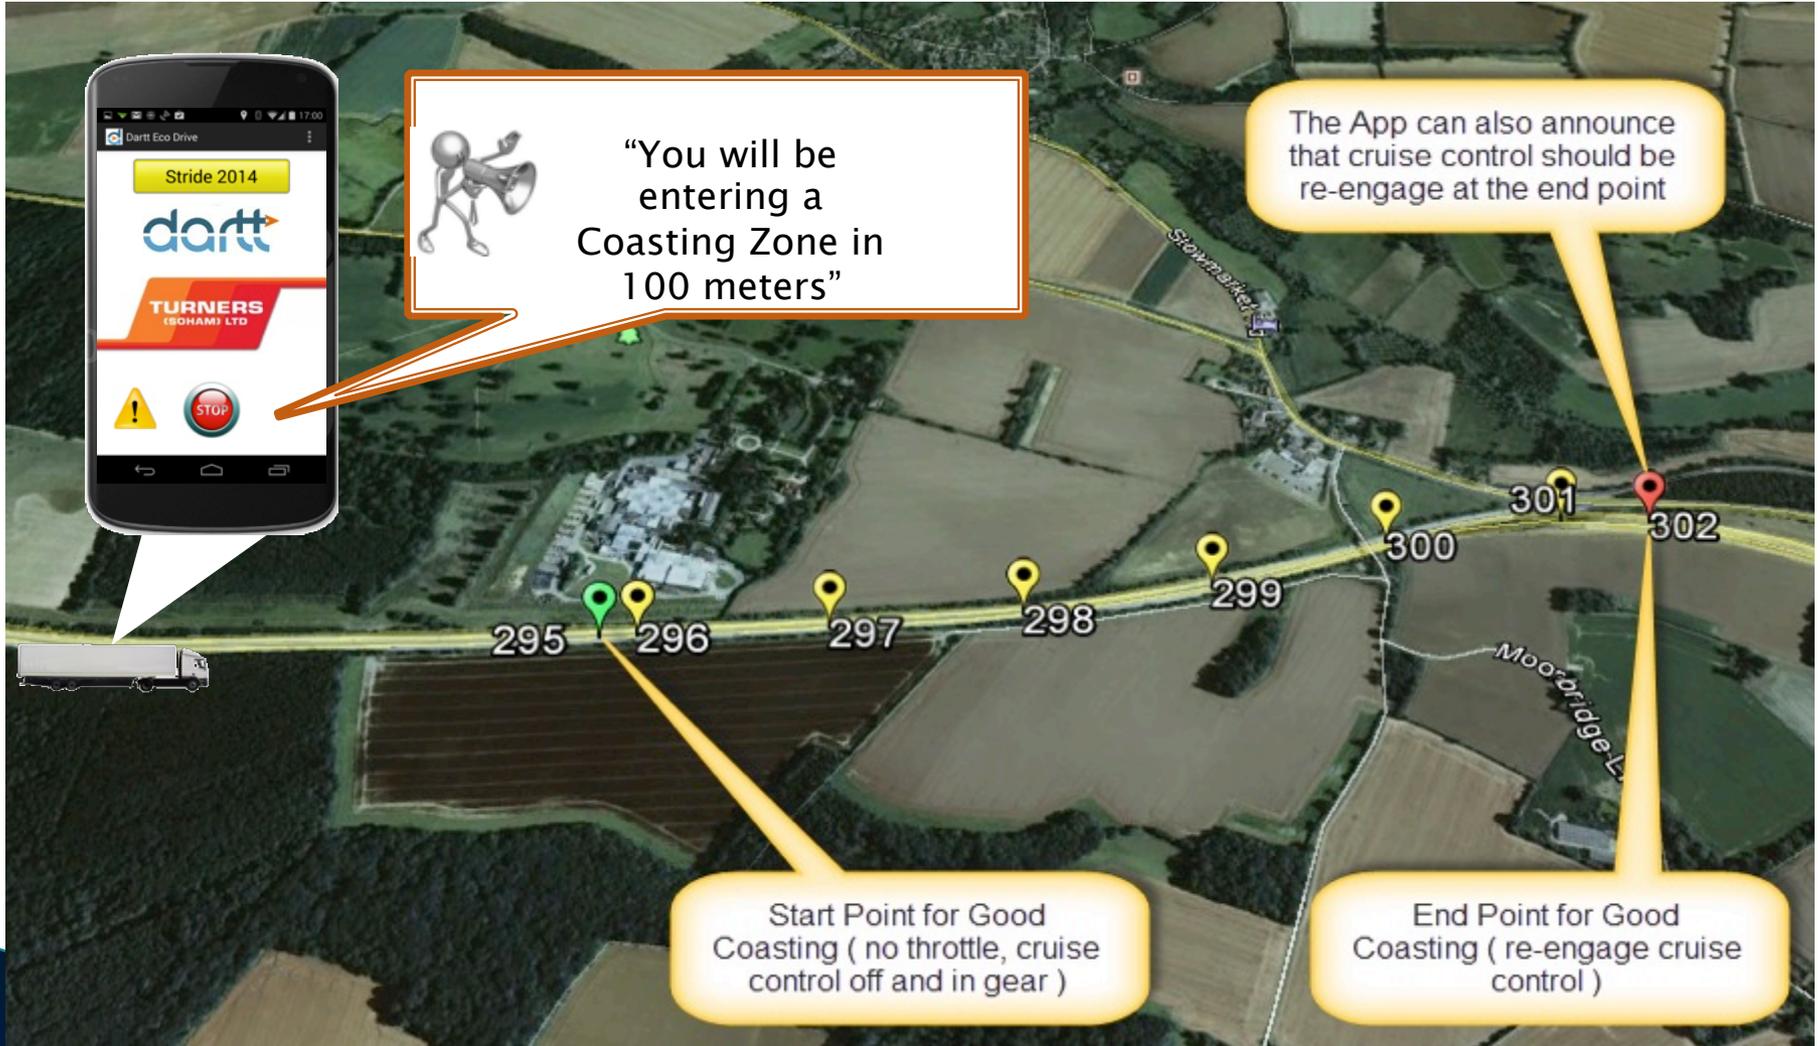

Initial purchase of 10 units from  
Turners

Interest from National Express &  
BT Fleet

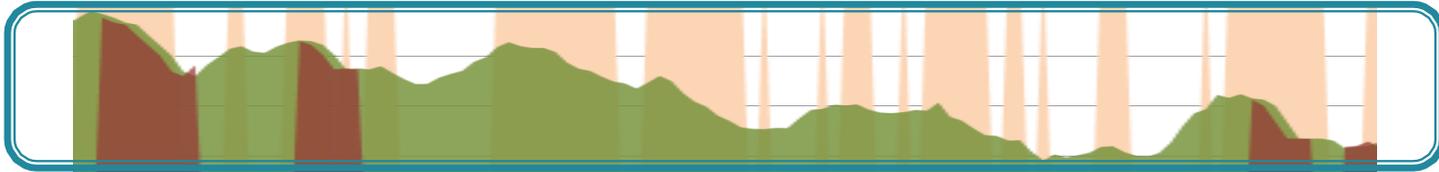

# Driver Assist: Ensuring maximum fuel efficiency and reducing emissions

- The **Driver Assist App** constantly checks the vehicle location, speed and the other essential information. Advises driver of coasting opportunities

# Altitude vs Eco Drive

Driver Assist can now auto-predict locations for any known route (eg KML) based on :-

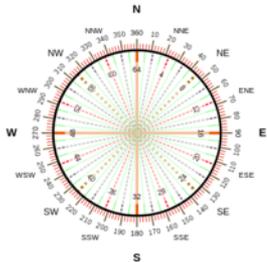

- Altitude change
- Speed of vehicle
- Direction of travel

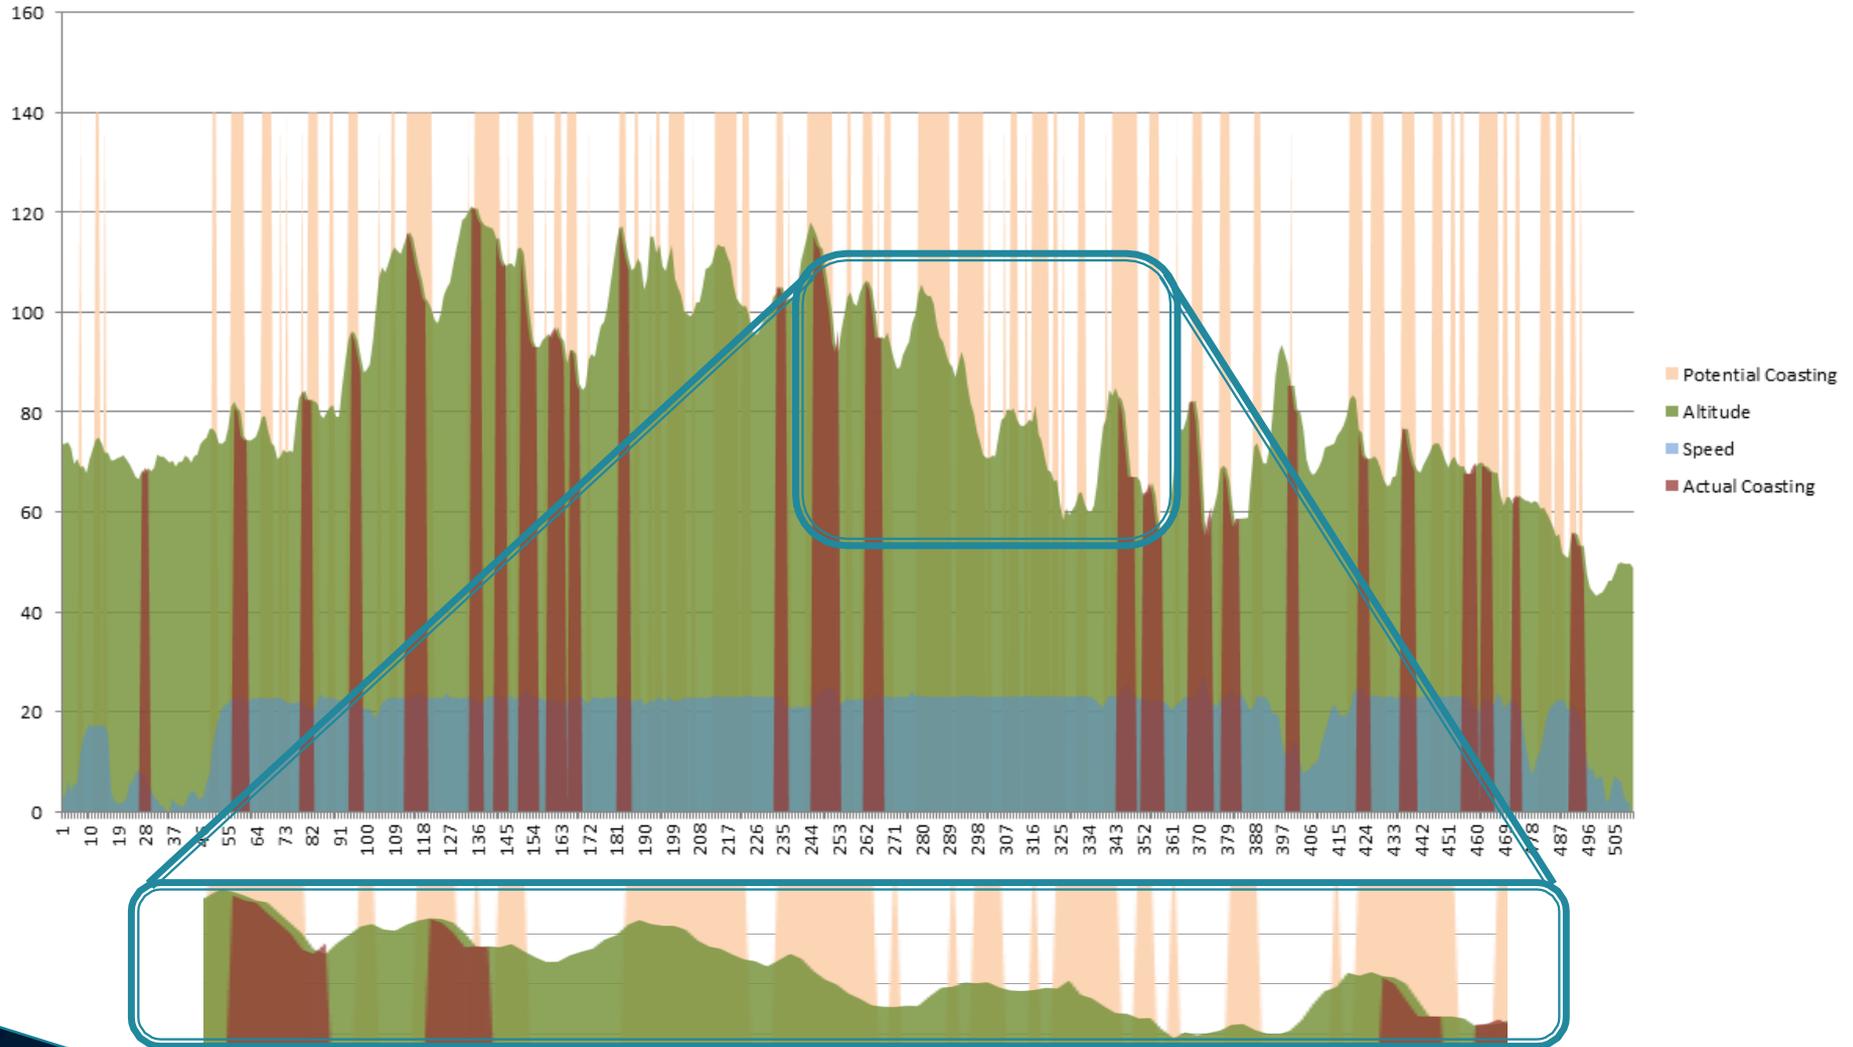

Additional data could include :-

- Gross weight of tractor and trailer (rolling distance)
- Weather (wind)
- Driver activities such as location-specific delivery instructions (speed limits, etc)

# Altitude vs Eco Drive

# What are the benefits?

- ▶ Reduced costs, CO2 reduction
- ▶ Smarter approach to fuel usage based on a wider range of data
  - road conditions, weather, traffic volumes, gradient, route
  - Turners: 1.6p per mile savings
- ▶ UK HGV fleet: 15.43 Billion miles per year @1.6p per mile
  - **£246m**

# JUMPA Application

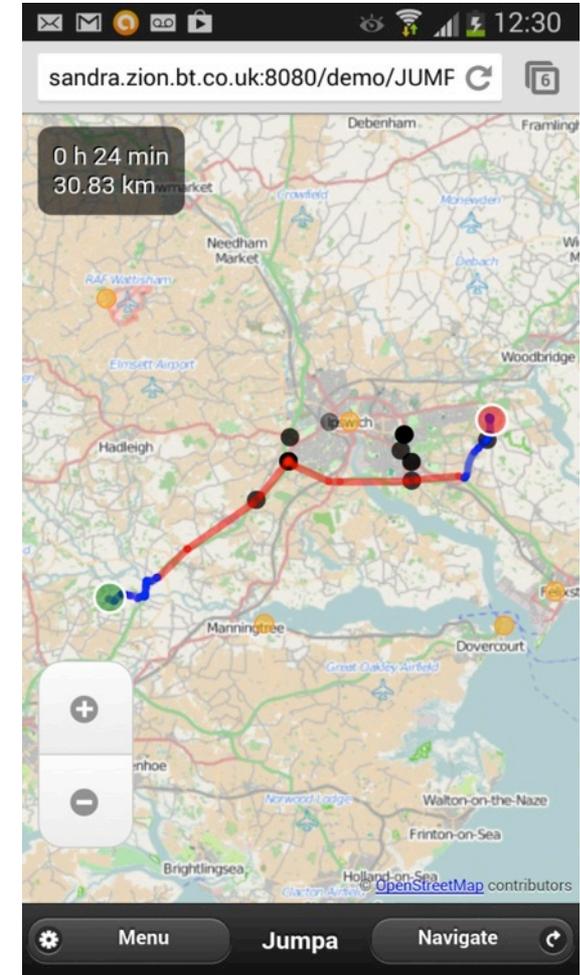

# JUMPA – Journey Planning & Prediction

- Results based on departure time, combining real-time data and predictive model
- Integration of information from multiple data sources, filtered by route
- Same experience across different devices and browsers (smartphones, web interface)
- Good performance in pilot, journal paper in preparation

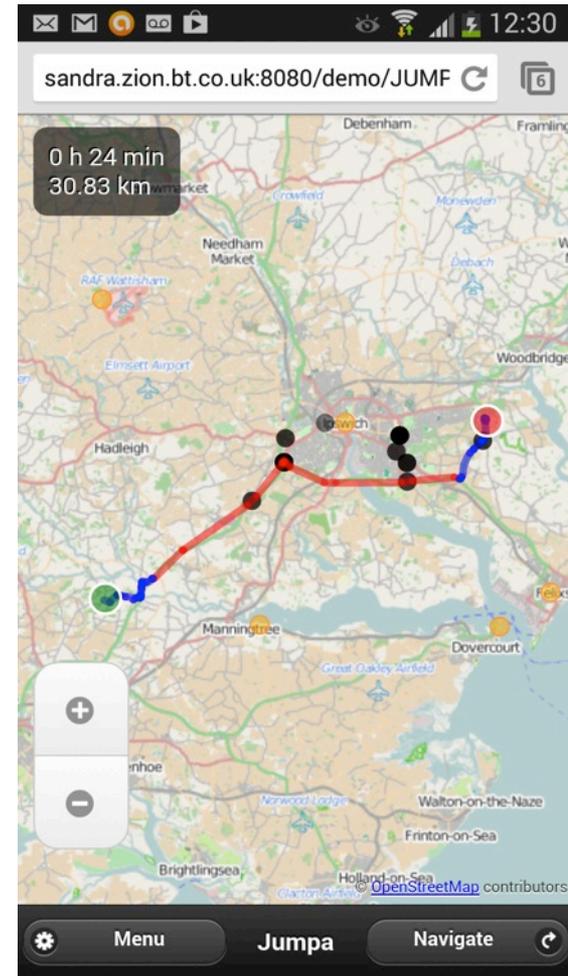

## Exploitation:

- Primarily as a service for other apps
- Usage in Driver Behaviour App & Travel Dashboard
- Interest from Turners for suggested departure time service

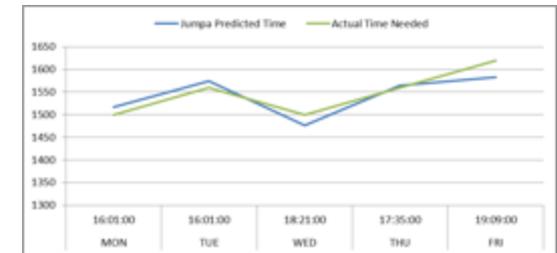

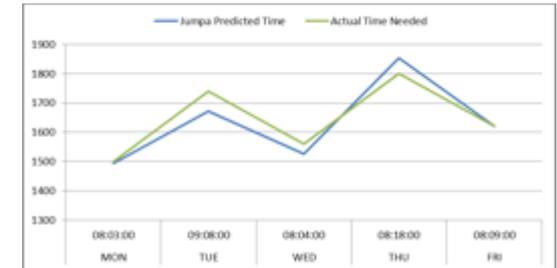

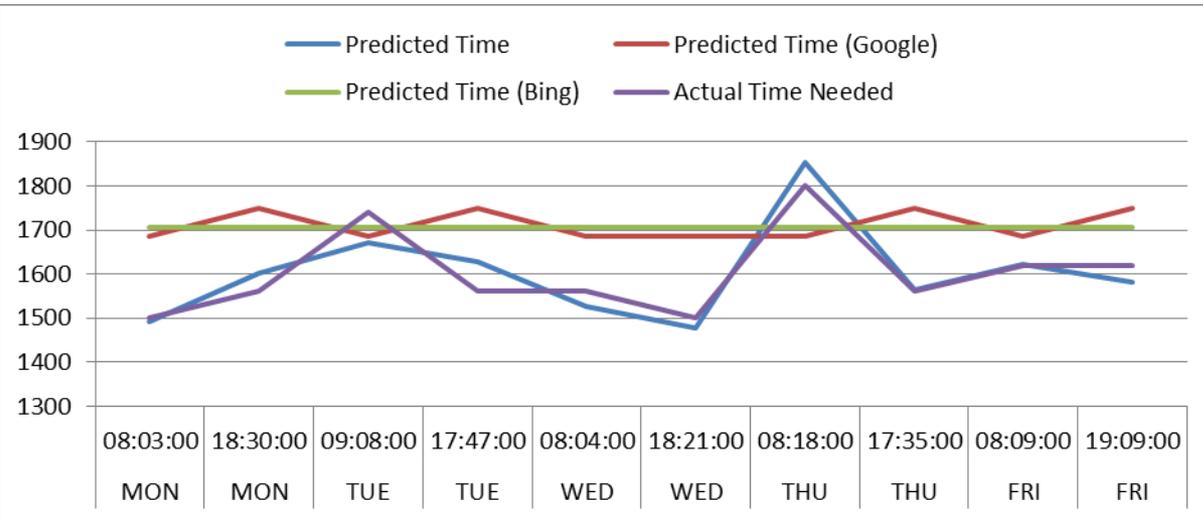

# JUMPA Features

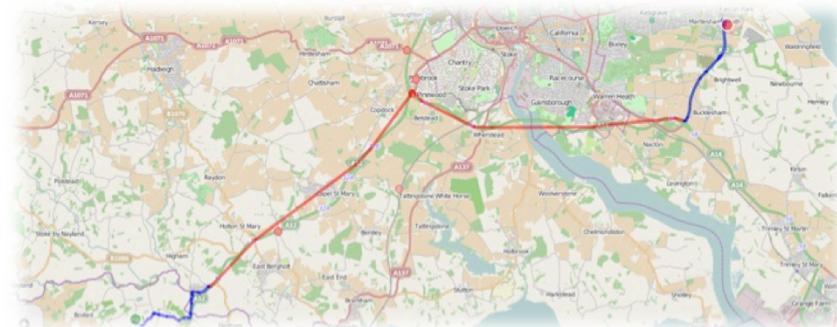

- ▶ Use of journey time prediction service
- ▶ Results based on the chosen departure time
- ▶ Filtered retrieval of information along the route
- ▶ Same experience across different devices and browsers (smartphones, web interface)

# JUMPA trial

- ▶ Route over trunk (A12,A14) and non-trunk roads
- ▶ Comparing predicted against achieved time
- ▶ Comparing against other web services

# Driver Behaviour Application

# Driver Behaviour Application

- Simple to use with a “Start/Stop” button
- Monitors Driver Behaviour using built in sensors and data from the BT Hub
- Provides data back to the Hub including pothole location and severity, road speed data, road surface index and User Events
- Integrated with Jumpa, weather information and six other data sources from the BT Hub
- Text-to-speech engine reads relevant info from the Hub to the driver during a journey

**Pothole and road surface Analysis**

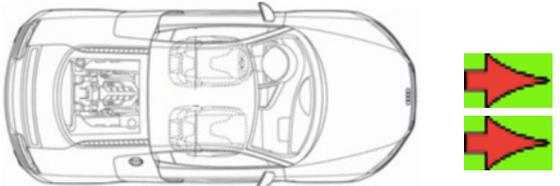

**Automatic queue detection**

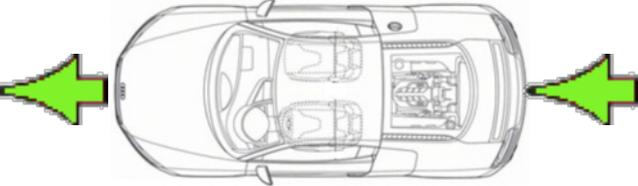

**Engine Idling Monitor**

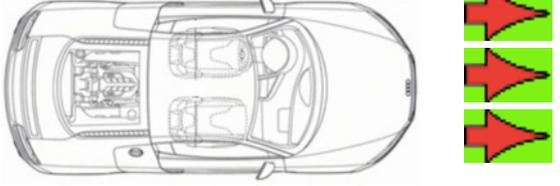

**Driver Notification**

**Over Speeding**

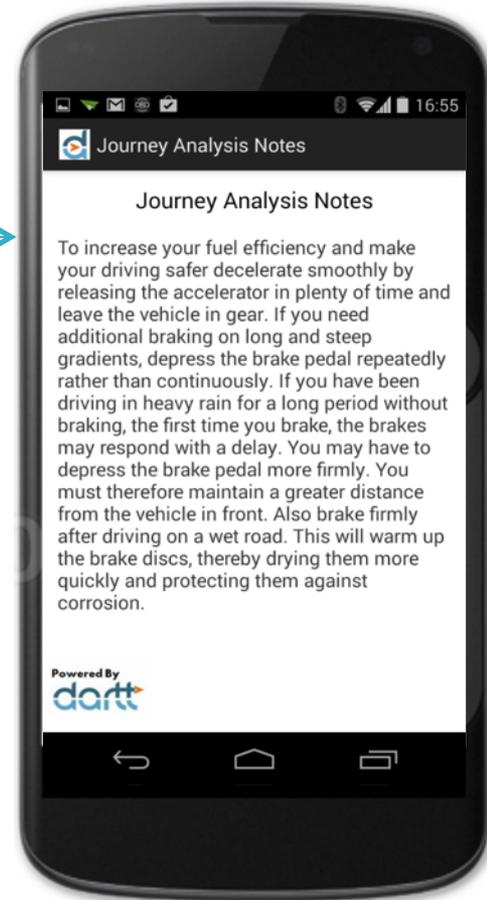

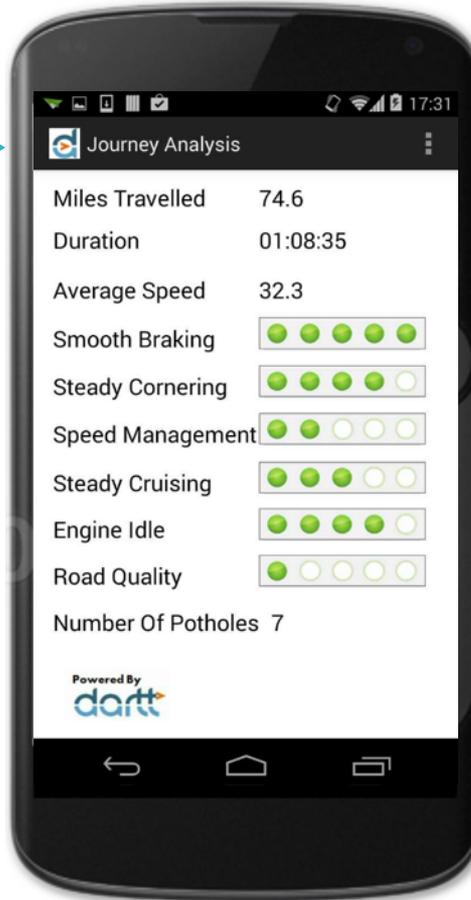

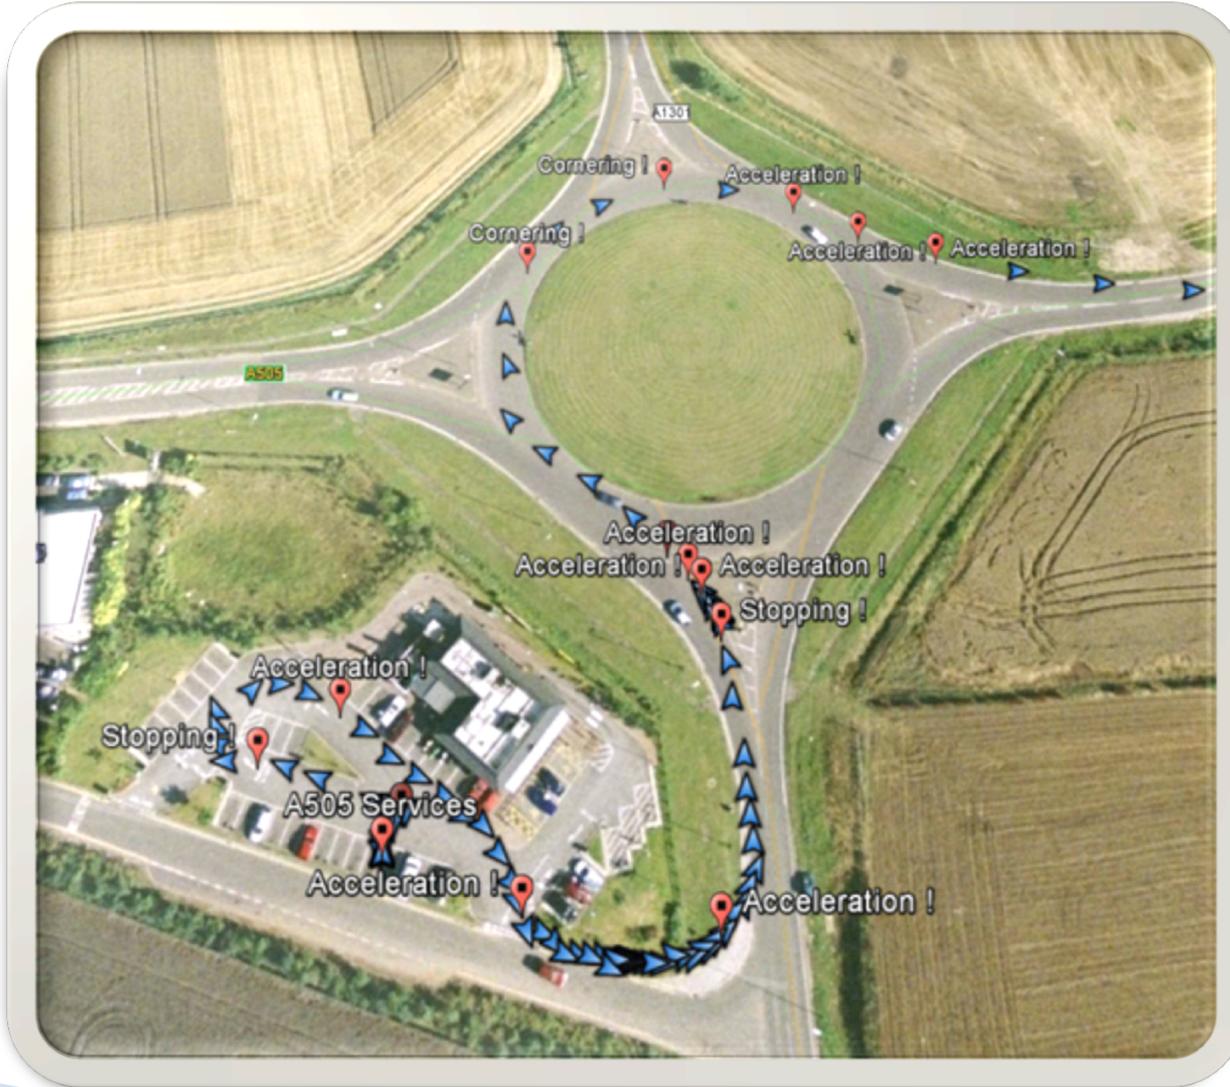

**Use of Cruise Control**

**Excessive Speeding**

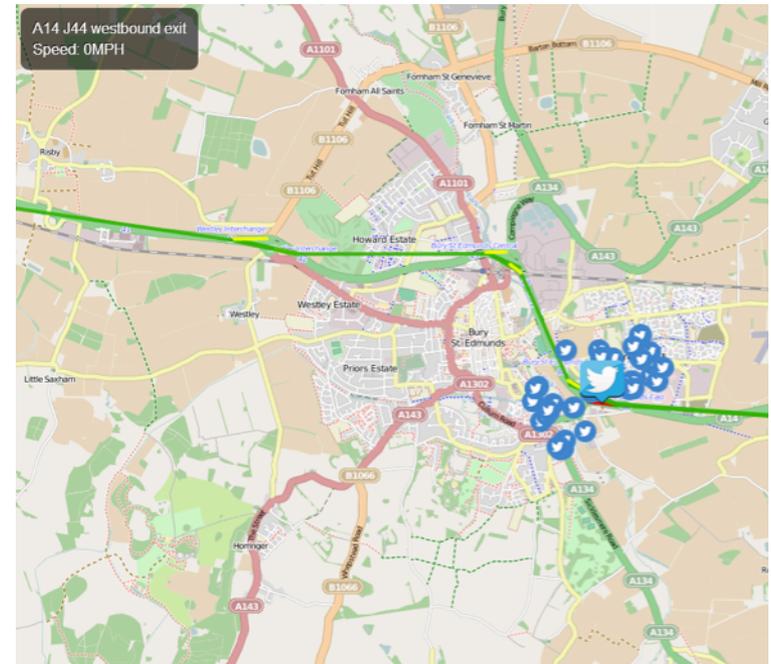

# Traffic Incident Alerting Application

- ▶ Combining traffic speed and incident data with social media analysis
- ▶ App for road users:
  - better information about nature and severity of delays
  - provide information via integrated channel
- ▶ Application for emergency services, local authorities, etc.:
  - Wider source of data about incident from social media

# Traffic Incident Alerting

- Colour coded routes based on live road speeds
- Display of tweets near selected location
- Provides a legal and safe way for drivers to tweet about incidents
  - Auto tweet button via app authorisation
  - Tweets location, heading, speed etc. via hub
  - Tweets back with information about incidents
  - Encourages use of existing medium (Twitter) rather than trying to establish new one.

# TIA - AutoTweet

- Low volume of tweets observed around incidents
- Need a legal and safe way for drivers to tweet about incidents
- AutoTweet button with Twitter app authorisation
- Tweets location, heading, speed etc. via hub
- Tweets back with information about incident
- Encourages use of existing medium (Twitter) rather than trying to establish new one.

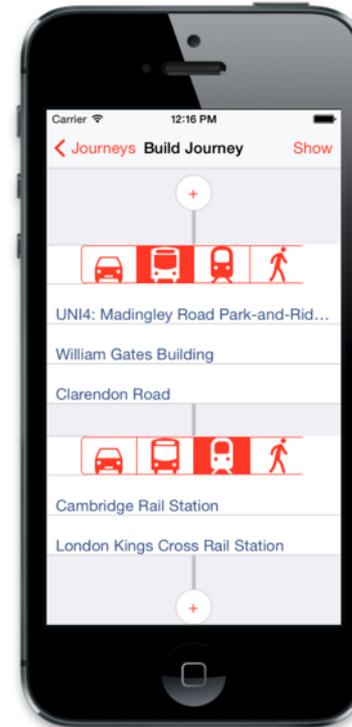

# Travel Dashboard

# Travel Dashboard

- ▶ Helps users with multi-segment multi-modal journeys
- ▶ Key features missing from existing mobile applications:
  - Lets user choose their preferred routing and modes
  - Shows the interaction between journey segments
  - Uses historical/live data on actual performance, doesn't just believe the timetable!
  - Only app able to combine live information about multiple journey segments
- ▶ Source code released under Apache OSS license

# Travel Dashboard Demo

# Hackathon Events

- ▶ Cambridge – 9<sup>th</sup> October
- ▶ Glasgow – 5<sup>th</sup> November (with iMove)
- ▶ Liverpool – 29<sup>th</sup> November (with iMove)
- ▶ Leeds – 12<sup>th</sup> February
  - Joint with regional networks
- ▶ London – 18<sup>th</sup> March
  - Cabinet Office & Network Rail

# App Highlights : Railsponsibility

<http://dico.im/railspon>

A Twitter based app that allows the user to send a formatted tweet to start monitoring the train for potential delays. The backend would then start monitoring the train along the route, and in case there has been delay at the end of the journey, the app will tweet back details to support the user in claiming a refund.

# Key Project Outcomes

- ▶ Information Hub deployed with 30+ sets of homogenised data
- ▶ Set of apps showing illustrating benefits of hub and wider ecosystem
  - Exploitation paths identified
- ▶ Technical and commercial challenges and enablers identified and explored

<http://www.stride-project.com>

# Following Stride

- TSB Phase II – Hypercat project
  - Scaling Impact and Exploitation
  - Greater Interoperability
- MK:Smart
  - Innovative actions on **transport, energy** and **water** tackling crucial demand issues by realising innovative solutions on top of a data hub
  - An integrated programme of **business engagement**, aiming at facilitating business take-up of the innovation capability developed in MK:SMART and at fostering the development of new SMEs.
  - A **smart city education programme** targeting a wide range of audiences, from local schools to HE students and businesses.
  - Targeted actions **to engage citizens in the innovation process**

Thanks for Your Attention
